## Subqueries: Takeaways 🖻

by Dataquest Labs, Inc. - All rights reserved © 2019

## Syntax

• Writing subqueries:

• Returning rows that match a list of values:

```
SELECT Major_category FROM recent_grads

WHERE Major_category IN ('Business', 'Engineering')
```

## Concepts

- SQL is a declarative-programming language. Designers of SQL wants its users to focus on expressing computations over variable names.
- A subquery is a query nested within another query and must always be contained within parentheses.
- A subquery can exist within the **SELECT**, **FROM** or **WHERE** clause.
- We can use **IN** to specify a list of values we want to match against.
- When writing queries that have subqueries, we'll want to write our inner queries first.
- The subquery gets executed first whenever the query gets ran.
