# Visualizing Frequency Distributions: Takeaways

by Dataquest Labs, Inc. - All rights reserved © 2019

### **Syntax**

• Generating a bar plot for a frequency distribution table:

```
### Vertical bar plot ###
Series.value_counts().plot.bar()

### Horizontal bar plot ###
Series.value_counts().plot.barh()
```

• Generating a pie chart for a frequency distribution table:

```
### Using the defaults
                             ###
Series.value_counts().plot.pie()
    Making the pie chart
                               a circle
                                        and adding percentages
                                                                        labels
###
        matplotlib.pyplot
import
                                   plt
Series.value_counts().plot.pie(figsize
                                                 = (6,6),
                                                            autopct
'%.1f%%')
plt.ylabel('')
                   # removes
                               the label
                                            of the y-axis
```

• Generating a histogram for a **Series** :

#### Series.plot.hist()

## Concepts

- To visualize frequency distributions for *nominal* and *ordinal* variables, we can use:
  - Bar plots.
  - Pie charts.
- To visualize frequency distributions for variables measured on an interval or ratio scale, we can use a **histogram**.
- Depending on the shape of the histogram, we can have:
  - **Skewed** distributions:
    - Left skewed (negatively skewed) the tail of the histogram points to the left.
    - Right skewed (positively skewed) the tail of the histogram points to the right.
  - Symmetrical distributions:
    - **Normal** distributions the values pile up in the middle and gradually decrease in frequency toward both ends of the histogram.
    - **Uniform** distributions the values are distributed uniformly across the entire range of the distribution.
